QF-550 Self Etch Primer Rose

Self Etch Primer Rose is a primer that chemically protects against the corrosion process. Recommended for protecting bare metal, galvanized steel and aluminum, QF-550 helps to eliminate imperfections and can be lightly sanded.

Application

Sand existing coating and perform necessary repair. Clean area to be primed with Matrix System Wax & Grease Remover. Shake can for 1 minute after agitator ball rattles in can. Apply 2-3 wet coats to achieve hiding, allowing 7-10 minutes between coats. Allow minimum of 20 minutes before topcoat. Primer may be nib sanded using 400 grit or finer sandpaper if necessary. Recoat if sanding exposes bare metal. Turn can upside down and spray to clear actuator tip and prevent clogging.

Tech Tip

Flash/Sanding times will vary based on temperature and application.
